[Click here to view legacy datasheet](#)

Conductivity probe range

The EZO™ Conductivity circuit is capable of connecting to any two-conductor conductivity probe, ranging from:

K 0.1

K 10

Atlas Scientific™ has tested 3 different K value probe types

K 0.1

accurate reading range

0.07 μ S – 50,000 μ S

K 1.0

accurate reading range

5 μ S – 200,000+ μ S

K 10

accurate reading range

10 μ S – 1S

Atlas Scientific™ does not know what the accurate reading range would be for conductivity probes, other than the above mentioned values. Determining the accurate reading range of such probes, i.e. **K 2.6**, or **K 0.66**, is the responsibility of the embedded systems engineer.

Resolution

The EZO™ Conductivity circuit, employs a method of scaling resolution. As the conductivity increases the resolution between readings decreases.

The EZO™ Conductivity circuit will output conductivity readings where the first **4 digits** are valid and the others are set to 0. This excludes conductivity readings that are less than 9.99. In that case, only 3 conductivity digits will be output.

0.07 – 99.99

Resolution = **0.01 μ S**

100.1 – 999.9

Resolution = **0.1 μ S**

1,000 – 9,999

Resolution = **1.0 μ S**

10,000 – 99,990

Resolution = **10 μ S**

100,000 – 999,900

Resolution = **100 μ S**

Operating principle

An E.C. (**electrical conductivity**) probe measures the electrical conductivity in a solution. It is commonly used in hydroponics, aquaculture and freshwater systems to monitor the amount of nutrients, salts or impurities in the water.

Inside the conductivity probe, two electrodes are positioned opposite from each other, an AC voltage is applied to the electrodes causing cations to move to the negatively charged electrode, while the anions move to the positively electrode. The more free electrolyte the liquid contains, the higher the electrical conductivity.

K 0.1
Graphite electrode

K 1.0
Graphite electrode

K 10
Platinum electrode

Output units

By default, EZO™ Conductivity circuits with firmware version 2.10 and above will *only* output EC. To enable these parameters see page 31 for UART, and 56 for I²C.

The EZO™ Conductivity circuit also has the capability to read:

- Conductivity = $\mu\text{S}/\text{cm}$**
- Total dissolved solids = ppm**
- Salinity = PSU**
- Specific gravity (sea water only) = 1.00 – 1.300**

These parameters must be individually enabled within the device. See page 31 to enable each parameter in UART mode, and on page 56 for I²C mode.

Once these parameters have been enabled, output will be a CSV string.

Example

EC,TDS,SAL,SG

Default LED blink pattern

This is the LED pattern for Continuous Mode (*default state*)
This can only happen when the device is in **UART** mode.

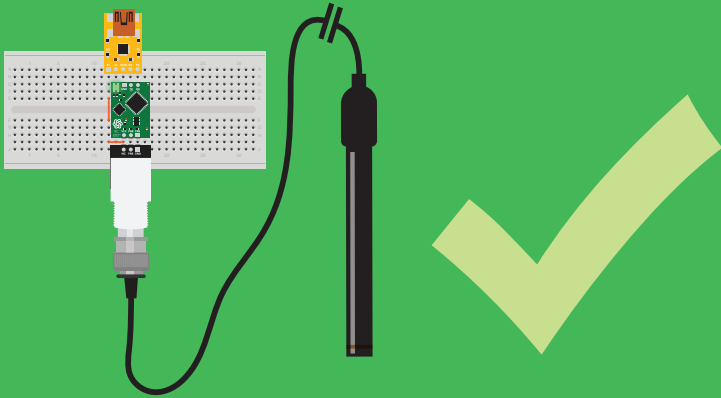

Calibration theory

The most important part of calibration is watching the readings during the calibration process. It's easiest to calibrate the device in its default state (UART mode, continuous readings). Switching the device to I²C mode after calibration **will not** affect the stored calibration. If the device must be calibrated in I²C mode be sure to request readings continuously so you can see the output from the probe.

Pre-calibration setup

First, take readings from dry conductivity probe.

Set probe type

If you are not using a K 1.0 conductivity probe (*default*), you need to set the probe type by using the "**K,n**" command. (*where n = K value of your probe*)

Dry calibration

Issuing the "**Cal,dry**" command fine tunes the internal electrical properties of the device. This calibration only needs to be done once. Even though you may see reading of 0.00 before issuing the "**Cal,dry**" command, it is still a necessary component of calibration.

17.00 → "**Cal,dry**" → 0.00 ✓ **Correct**

00.00 → "**Cal,dry**" → 0.00 ✓ **Correct**

Temperature compensation

Temperature has a significant effect on conductivity readings. The EZO™ Conductivity circuit has its temperature compensation set to 25° C as the default. If the calibration solution is not within 5° of 25° C, check the temperature chart on the side of the calibration bottle, and calibrate to that value.

Low point/single point calibration

Pour a small amount of the calibration solution into a cup. Shake the probe to make sure you do not have trapped air bubbles in the sensing area. You should see readings that are off by **1 – 40%** from the stated value of the calibration solution. Wait for readings to stabilize (small movement from one reading to the next is normal).

Trapped air
(shake to remove)

+/- 40%

**check probe connection,
you cannot calibrate to 0.**

Once the readings stabilize, issue the low point or single point calibration command.

Low point calibration: **"Cal,low,1413"** (Readings will **NOT** change)

Single point calibration: **"Cal,1413"** (Readings **will** change, calibration complete).

High point calibration

Shake the probe to remove trapped air and adjust the temperature as done in the previous step. Once the readings have stabilized issue the high point calibration command.

High point calibration: **"Cal,high,12880"** (Readings **will** change, calibration complete).

Power and data isolation

The Atlas Scientific EZO™ Conductivity circuit is a very sensitive device. This sensitivity is what gives the Conductivity circuit its accuracy. This also means that the Conductivity circuit is capable of reading micro-voltages that are bleeding into the water from unnatural sources such as pumps, solenoid valves or other probes/sensors.

When electrical noise is interfering with the Conductivity readings it is common to see rapidly fluctuating readings or readings that are consistently off. To verify that electrical noise is causing inaccurate readings, place the Conductivity probe in a cup of water by itself. The readings should stabilize quickly, confirming that electrical noise was the issue.

When reading from two EZO™ Conductivity circuits, it is **strongly recommended** that they are electrically isolated from each other.

Basic EZO™
Inline Voltage Isolator

Without isolation, Conductivity readings will effect each other.

This schematic shows exactly how we isolate data and power using the [ADM3260](#) and a few passive components. The ADM3260 can output isolated power up to 150 mW and incorporates two bidirectional data channels.

This technology works by using tiny transformers to induce the voltage across an air gap. PCB layout requires special attention for EMI/EMC and RF Control, having proper ground planes and keeping the capacitors as close to the chip as possible are crucial for proper performance. The two data channels have a 4.7kΩ pull up resistor on both the isolated and non-isolated lines (R1, R2, R3, and R4) The output voltage is set using a voltage divider (R5, R6, and R7) this produces a voltage of 3.9V regardless of your input voltage.

Isolated ground is different from non-isolated ground, these two lines should not be connected together.

VCC = 3.0v – 5.5v

Change to I²C mode

Command syntax

Default I²C address 100 (0x64)

I2C,n <cr> sets I²C address and reboots into I²C mode

n = any number 1 – 127

Example

I2C,100 <cr>

Response

*OK (reboot in I²C mode)

Wrong example

I2C,139 <cr> n ≠ 127

Response

*ER <cr>

I2C,100

Green
*OK <cr>

(reboot)

Blue
now in I²C mode

Manual switching to I²C

- Make sure Plock is set to 0
- Disconnect ground (power off)
- Disconnect TX and RX
- Connect TX to the right PRB
- Confirm RX is disconnected
- Connect ground (power on)
- Wait for LED to change from Green to Blue
- Disconnect ground (power off)
- Reconnect all data and power

Manually switching to I²C will set the I²C address to 100 (0x64)

Example

Wrong Example

I²C mode

The I²C protocol is **considerably more complex** than the UART (RS-232) protocol. Atlas Scientific assumes the embedded systems engineer understands this protocol.

To set your EZO™ device into I²C mode click [here](#)

Response codes

After a command has been issued, a 1 byte response code can be read in order to confirm that the command was processed successfully.

Reading back the response code is completely optional, and is not required for normal operation.

Example

```
I2C_start;  
I2C_address;  
I2C_write(EZO_command);  
I2C_stop;
```

delay(300);

Processing delay

```
I2C_start;  
I2C_address;  
Char[ ] = I2C_read;  
I2C_stop;
```

The response code will always be 254, if you do not wait for the processing delay.

Response codes

Single byte, not string

| | |
|------------|------------------------------------|
| 255 | no data to send |
| 254 | still processing, not ready |
| 2 | syntax error |
| 1 | successful request |

command quick reference

All commands are ASCII strings or single ASCII characters.

| Command | Function | |
|-----------------------|--------------------------------------|---------------|
| Baud | switch back to UART mode | pg. 63 |
| Cal | performs calibration | pg. 52 |
| Export/import | export/import calibration | pg. 53 |
| Factory | enable factory reset | pg. 62 |
| Find | finds device with blinking white LED | pg. 50 |
| i | device information | pg. 57 |
| I²C | change I ² C address | pg. 61 |
| K | Set probe type | pg. 54 |
| L | enable/disable LED | pg. 49 |
| O | enable/disable parameters | pg. 56 |
| Plock | enable/disable protocol lock | pg. 60 |
| R | returns a single reading | pg. 51 |
| Sleep | enter sleep mode/low power | pg. 59 |
| Status | retrieve status information | pg. 58 |
| T | temperature compensation | pg. 55 |

LED control

Command syntax

300ms  processing delay

- L,1 LED on **default**
- L,0 LED off
- L,? LED state on/off?

Example

Response

L,1

Wait 300ms **1** **0**
Dec Null

L,0

Wait 300ms **1** **0**
Dec Null

L,?

Wait 300ms **1** **?L,1** **0** or **1** **?L,0** **0**
Dec ASCII Null Dec ASCII Null

L,1

L,0

Find

300ms  processing delay

Command syntax

This command will disable continuous mode
Send any character or command to terminate find.

Find LED rapidly blinks white, used to help find device

Example

Response

Find

 Wait 300ms
1 Dec 0 Null

Taking reading

Command syntax

600ms  processing delay

R return 1 reading

Example

Response

R  **1** **1,413** **0**
Wait 600ms Dec ASCII Null

Taking reading

Transmitting

Blue

Standby

Calibration

600ms  processing delay

Command syntax

Dry calibration must always be done first!

| | |
|------------|---|
| Cal,dry | dry calibration |
| Cal,n | single point calibration, where n = any value |
| Cal,low,n | low end calibration, where n = any value |
| Cal,high,n | high end calibration, where n = any value |
| Cal,clear | delete calibration data |
| Cal,? | device calibrated? |

Example

Response

Cal,dry

 **Wait 600ms** **1** **0**
Dec Null

Cal,84

 **Wait 600ms** **1** **0**
Dec Null

Cal,low,12880

 **Wait 600ms** **1** **0**
Dec Null

Cal,high,80000

 **Wait 600ms** **1** **0**
Dec Null

Cal,clear

 **Wait 300ms** **1** **0**
Dec Null

Cal,?

 **Wait 300ms** **1** **?CAL,0** **0** or **1** **?CAL,1** **0** or **1** **?CAL,2** **0**
Dec ASCII Null Dec ASCII Null Dec ASCII Null
two point three point

Two point calibration:

Step 1. "cal,dry"

Step 2. "cal,n"

Calibration complete!

Three point calibration:

Step 1 "cal,dry"

Step 2 "cal,low,n"

Step 3 "cal,high,n"

Calibration complete!

Export/import calibration

Command syntax

Export: Use this command to save calibration settings
Import: Use this command to load calibration settings to one or more devices.

| | |
|----------|--|
| Export | export calibration string from calibrated device |
| Import | import calibration string to new device |
| Export,? | calibration string info |

Setting the probe type

Command syntax

300ms  processing delay

K,n n = any value; floating point in ASCII

K 1.0 is the default value

K,? probe K value?

Example

Response

K,10

 Wait 300ms
1 Dec 0 Null

K,?

 Wait 600ms
1 Dec K,10 ASCII 0 Null

K 0.1

K 1.0

K 10

Temperature compensation

Command syntax

Default temperature = 25°C
Temperature is always in Celsius
Temperature is not retained if power is cut

T,n n = any value; floating point or int 300ms  processing delay
T,? compensated temperature value?
RT,n set temperature compensation and take a reading*

This is a new command for firmware V2.13

Example

Response

T,19.5

 Wait 300ms 1 0
Dec Null

RT,19.5

 Wait 900ms 1 8.91 0
Dec ASCII Null

T,?

 Wait 300ms 1 ?T,19.5 0

Enable/disable parameters from output string

Command syntax

300ms  processing delay

O, [parameter],[1,0]

enable or disable output parameter

O,?

enabled parameter?

Example

Response

O,EC,1 / O,EC,0

 **1** **0** enable / disable conductivity
Wait 300ms Dec Null

O,TDS,1 / O,TDS,0

 **1** **0** enable / disable total dissolved solids
Wait 300ms Dec Null

O,S,1 / O,S,0

 **1** **0** enable / disable salinity
Wait 300ms Dec Null

O,SG,1 / O,SG,0

 **1** **0** enable / disable specific gravity
Wait 300ms Dec Null

O,?

 **1** **? , O, EC, TDS, S, SG** **0** if all are enabled
Wait 300ms Dec ASCII Null

Parameters

EC conductivity
TDS total dissolved solids
S salinity
SG specific gravity

Followed by 1 or 0

1 enabled
0 disabled

*** If you disable all possible data types your readings will display "no output".**

Device information

Reading device status

Command syntax

300ms  processing delay

Status voltage at Vcc pin and reason for last restart

Example

Response

Status

 **1** **?Status,P,5.038** **0**
Wait 300ms Dec ASCII Null

Response breakdown

?Status, **P,** **5.038**
Reason for restart Voltage at Vcc

Restart codes

P powered off
S software reset
B brown out
W watchdog
U unknown

Sleep mode/low power

Command syntax

Sleep enter sleep mode/low power

Send any character or command to awaken device.

Example

Response

Sleep

no response

Do not read status byte after issuing sleep command.

Any command

wakes up device

5V

| STANDBY | SLEEP |
|----------|--------|
| 18.14 mA | 0.7 mA |

3.3V

| | |
|----------|--------|

| 1 | ?Plock,1 | 0 |
| Dec | ASCII | Null |

Plock,1

Baud, 9600

cannot change to UART

cannot change to UART

I²C address change

Command syntax

300ms  processing delay

I2C,n sets I²C address and reboots into I²C mode

Example

Response

I2C,101

device reboot

Warning!

Changing the I²C address will prevent communication between the circuit and the CPU until your CPU is updated with the new I²C address.

Default I²C address is 100 (0x64).

n = any number 1 – 127

I2C,101

(reboot)

Factory reset

Command syntax

Factory reset will not take the device out of I²C mode.

Factory enable factory reset

I²C address will not change

Example

Response

Factory

device reboot

Clears calibration
LED on
Response codes enabled

Factory

(reboot)

Change to UART mode

Command syntax

Baud,n switch from I²C to UART

Example

Baud,9600

Response

reboot in UART mode

n = [300
1200
2400
9600
19200
38400
57600
115200

Baud,9600

Changing to
UART mode

(reboot)

Manual switching to UART

- Make sure Plock is set to 0
- Disconnect ground (power off)
- Disconnect TX and RX
- Connect TX to the right PRB
- Confirm RX is disconnected
- Connect ground (power on)
- Wait for LED to change from Blue to Green
- Disconnect ground (power off)
- Reconnect all data and power

Example

Wrong Example

EZO™ circuit footprint

1 In your CAD software, place a 8 position header.

2 Place a 3 position header at both top and bottom of the 8 position.

3 Delete the 8 position header. The two 3 position headers are now 17.78mm (0.7") apart from each other.

Datasheet change log

Datasheet V 5.4

Revised isolation schematic on pg. 13

Datasheet V 5.3

Added new command:

"RT,n" for Temperature compensation located on pages 30 (UART) & 55 (I²C).
Added firmware information to Firmware update list.

Datasheet V 5.2

Revised calibration information on pages 27 & 52.

Datasheet V 5.1

Added more information about temperature compensation on pages 30 & 55.

Datasheet V 5.0

Changed "Max rate" to "Response time" on cover page.

Datasheet V 4.9

Removed note from certain commands about firmware version.
Added steps to calibration command pages 27 (UART) and 52 (I²C).

Datasheet V 4.8

Revised definition of response codes on pg 46.

Datasheet V 4.7

Revised cover page art.

Datasheet V 4.6

Updated calibration processing delay time on pg.52.

Datasheet V 4.5

Revised Enable/disable parameters information on pages 31 & 56.

Datasheet change log

Datasheet V 4.4

Updated High point calibration info on page 11.

Datasheet V 4.3

Updated calibration info on pages 27 (UART) and 52 (I²C).

Datasheet V 4.2

Revised Plock pages to show default value.

Datasheet V 4.1

Corrected I²C calibration delay on pg. 52.

Datasheet V 4.0

Revised entire datasheet.

Firmware updates

V1.0 – Initial release (April 17, 2014)

V1.1 – (June 2, 2014)

- Change specific gravity equation to return 1.0 when the uS reading is < 1000 (previously returned 0.0)
- Change accuracy of specific gravity from 2 decimal places to 3 decimal places
- Don't save temperature changes to EEPROM

V1.2 – (Aug 1, 2014)

- Baud rate change is now a long, purple blink

V1.5 – Baud rate change (Nov 6, 2014)

- Change default baud rate to 9600

V1.6 – I2C bug (Dec 1, 2014)

- Fixed I²C bug where the circuit may inappropriately respond when other I2C devices are connected.

V1.8 – Factory (April 14, 2015)

- Changed "X" command to "Factory"

V1.95 – Plock (March 31, 2016)

- Added protocol lock feature "Plock"

V1.96 – EEPROM (April 26, 2016)

- Fixed glitch where EEPROM would get erased if the circuit lost power 900ms into startup

V2.10 – (April 12, 2017)

- Added "Find" command.
- Added "Export/import" command.
- Modified continuous mode to be able to send readings every "n" seconds.
- Default output changed from CSV string of 4 values to just conductivity; Other values must be enabled.

V2.11 – (April 28, 2017)

- Fixed "Sleep" bug, where it would draw excessive current.

V2.12 – (May 9, 2017)

- Fixed glitch in sleep mode, where circuit would wake up to a different I²C address.

V2.13 – (July 16, 2018)

- Added "RT" command to Temperature compensation.

Warranty

Atlas Scientific™ Warranties the EZO™ class Conductivity circuit to be free of defect during the debugging phase of device implementation, or 30 days after receiving the EZO™ class Conductivity circuit (which ever comes first).

The debugging phase

The debugging phase as defined by Atlas Scientific™ is the time period when the EZO™ class Conductivity circuit is inserted into a bread board, or shield. If the EZO™ class Conductivity circuit is being debugged in a bread board, the bread board must be devoid of other components. If the EZO™ class Conductivity circuit is being connected to a microcontroller, the microcontroller must be running code that has been designed to drive the EZO™ class Conductivity circuit exclusively and output the EZO™ class Conductivity circuit data as a serial string.

It is important for the embedded systems engineer to keep in mind that the following activities will void the EZO™ class Conductivity circuit warranty:

- **Soldering any part of the EZO™ class Conductivity circuit.**
- **Running any code, that does not exclusively drive the EZO™ class Conductivity circuit and output its data in a serial string.**
- **Embedding the EZO™ class Conductivity circuit into a custom made device.**
- **Removing any potting compound.**

Reasoning behind this warranty

Because Atlas Scientific™ does not sell consumer electronics; once the device has been embedded into a custom made system, Atlas Scientific™ cannot possibly warranty the EZO™ class Conductivity circuit, against the thousands of possible variables that may cause the EZO™ class Conductivity circuit to no longer function properly.

Please keep this in mind:

- 1. All Atlas Scientific™ devices have been designed to be embedded into a custom made system by you, the embedded systems engineer.**
- 2. All Atlas Scientific™ devices have been designed to run indefinitely without failure in the field.**
- 3. All Atlas Scientific™ devices can be soldered into place, however you do so at your own risk.**

Atlas Scientific™ is simply stating that once the device is being used in your application, Atlas Scientific™ can no longer take responsibility for the EZO™ class Conductivity circuits continued operation. This is because that would be equivalent to Atlas Scientific™ taking responsibility over the correct operation of your entire device.
